

GGPLOT CHEATSHEET

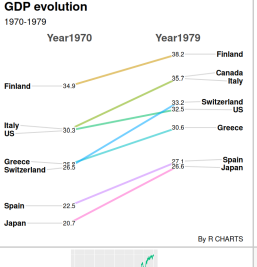

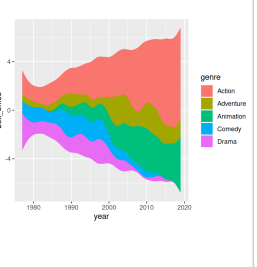

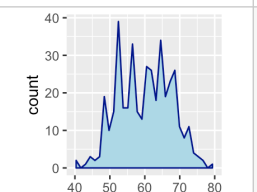

I. Distribution

	Code	Graph	Argument/function notes
Histogram (Display quantitative variable ; Better visualizing the shape of the data distribution)	<code>ggplot(df, aes(x = x))</code> + <code>geom_histogram()</code>		<ul style="list-style-type: none">binwidth: control bin size
Density Plot (Smoothed version of histogram)	<code>ggplot(df, aes(x = x))</code> + <code>geom_density()</code>		<ul style="list-style-type: none">fill: change fill colorscolor: change line colorslinetype: change line typeadjust: adjust the bandwidth(smoothness)
Boxplot (Display continuous variable ; Better visualize summary statistics and outlying points individually)	<code>ggplot(df, aes(y = y))</code> + <code>geom_boxplot()</code>		<ul style="list-style-type: none">outlier.colour, outlier.shape, outlier.size: Change the color, the shape and the size for outlying pointsnotch: =TRUE add notches to assess whether the medians are different
Ridgeline Plot (Useful for visualizing changes in distributions over time or space)	<code>library(ggbridges)</code> <code>ggplot(df, aes(x = value, y = category))</code> + <code>geom_density_ridges()</code>		<ul style="list-style-type: none">stat: change shape of each distributionrel_min_height: cut the trailing tailsscale: control the scaling of the ridgelines relative to the spacing between themquantile: control which or how many quantiles are displayed
Violin Plot (Like density plot ; Useful for comparison of distributions between several groups — peaks&valleys&tails)	<code>ggplot(df, aes(x = category, y = value))</code> + <code>geom_violin()</code>		<ul style="list-style-type: none">trim: =TRUE(default) trim the tails of the violinsfill: change fill colorsstat_summary: add mean/median pointsCan combine with geom_boxplot()
Beeswarm Plot (suitable for a relatively small number of measurements due to the non-overlapping of each point)	<code>library(ggbeeswarm)</code> <code>ggplot(df, aes(x = group, y = y))</code> + <code>geom_beeswarm()</code>		<ul style="list-style-type: none">cex: change spacingsize: change size of the pointspriority: change point layoutCan combine with geom_boxplot()

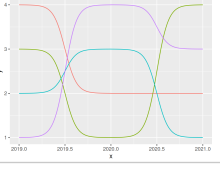

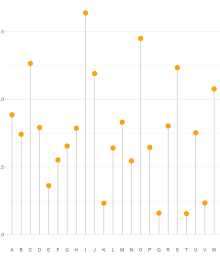

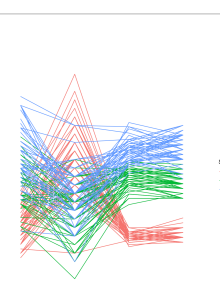

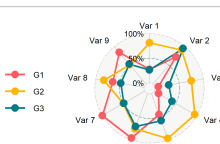

II. Correlation

	Code	Graph	Argument/function notes
Scatterplot (Display the relationship between two quantitative variables)	<code>ggplot(cars, aes(x = x, y = y))</code> + <code>geom_point()</code>		<ul style="list-style-type: none">geom_text: label pointsgeom_smooth/geom_abline: add regression line
Heatmap (Better visualize the volume of locations/events within a dataset)	<code>ggplot(df, aes(x = category, y = category, fill = value))</code> + <code>geom_tile()</code>		<ul style="list-style-type: none">color: change tiles colorlwd: change line widthlinetype: change line typegeom_text(aes(label=value)): add the values over the tiles
Hexbin chart (Useful for visualizing the relationship of two quantitative variables with a lot of data points)	<code>ggplot(df, aes(x = x, y = y))</code> + <code>geom_hex()</code>		<ul style="list-style-type: none">bin: change number of binscolor: change border colorfill: change color for all hexagonsalpha: control the transparency
Paris plot (Plot matrix — quickly see all relationships between each variables no matter categorical or numerical)	<code>library(GGally)</code> <code>ggpairs(df)</code>		<ul style="list-style-type: none">columns: select the columns of dataset to be plotted.aes(color=var): color by groupsupper/lower/diag: represents the location of the panelupper=list(continuous="smooth"): add scatterplots with lines"densityDiag", "barDiag", "blankDiag" can be assigned to continuouscombo: assign a different chart for the categorical variables."facetdensity", "count" can be assigned to combo
Contour plot (visualize 3d surfaces in 2d)	<code>ggplot(df, aes(x = x, y = y))</code> + <code>geom_density_2d()</code>		<ul style="list-style-type: none">can combine with geom_point()color: change line coloraes(color=.level.): colorize each contour line based on the levelgeom="polygon"/ geom_density_2d_filled(): fill the contourscale_fill_brewer()/ scale_fill_manual(): change fill color

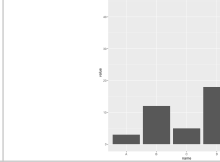

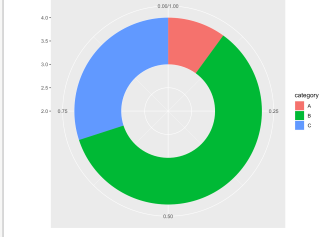

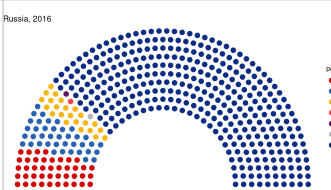

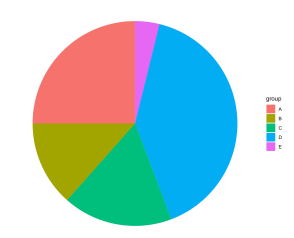

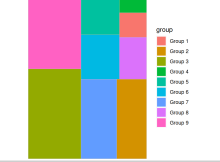

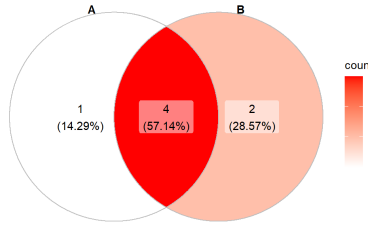

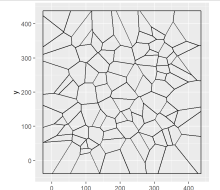

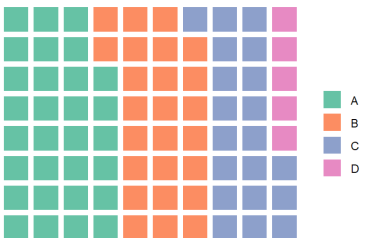

III. Evolution

	Code	Graph	Argument/function notes
Slopegraph (Continuous data: highlighting change over time) Categorical data: highlighting difference between two categories)	<code>library(CGPfunctions)</code> <code>newggslopegraph(dataframe = df, Times = Year, Measurement = GDP, Grouping = Country)</code>		<ul style="list-style-type: none">ReverseXAxis/ReverseYAxis: reverse axisLineColor: change line colorLineThickness: change line widthThemeChoice: modify theme("ipsum"/"econ"/"gdocs")
Line Graph (Comparison between different variables)	<code>ggplot(df, aes(x = index, y = value, color = variable))</code> + <code>geom_line()</code>		<ul style="list-style-type: none">linetype: change line stylelwd: change line width
Streamgraph (Display the evolution of a numeric variable for several groups)	<code>library(ggstream)</code> <code>ggplot(df, aes(x = year, y = value, fill = genre))</code> + <code>geom_stream()</code>		<ul style="list-style-type: none">geom_stream_label(aes(label=)): add the labels to each area of the streamgraphtype: change type(default:"mirror"; "ridge":stacks from x-axis; "proportional": streams sum up to 1)color: change border colorscale_fill_manual(values=cols): change the fill colors
Area plot (Color under density curve)	<code>ggplot(df, aes(x = index, y = value))</code> + <code>geom_area()</code>		<ul style="list-style-type: none">aes(y=..density..): set y axis as density valuecolor: change line colorfill: change fill colorlinetype: change line typefacet_grid(): split plots in multiple panels

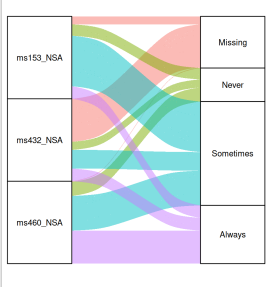

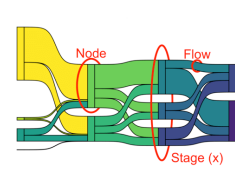

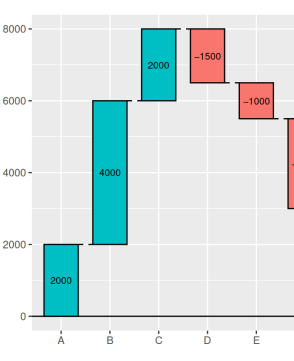

IV. Ranking

	Code	Graph	Argument/function notes
Bump Chart (Visualize change in rankings of different groups over time)	<code>library(ggbump)</code> <code>ggplot(df, aes(x = yera, y = ranking, color = group))</code> + <code>geom_bump()</code>		<ul style="list-style-type: none">Can combine with geom_point()scale_fill_brewer()/ scale_fill_manual(): change color of the lines and points
Lollipop chart (kind of bar chart; useful for making comparisons between different categories. Also, ranking or showing trends over time)	<code>ggplot(df, aes(x = group, y = value))</code> + <code>geom_segment(aes(x = group, xend = group, y = 0, yend = value))</code> + <code>geom_point()</code>		<ul style="list-style-type: none">coord_flip(): flip the chart; better to use when there are too many categorieslinetype: change line type("dotted", "dashed", "dottedash")geom_segment(y=?): change base line
Parallel Coordinate (visualizing high-dimensional datasets ; data frame must have several numeric variables)	<code>library(GGally)</code> <code>ggparcoord(data = df, column=1:4, groupColumn=5)</code> (column : several numeric variables to be axes groupColumn : a single categorical variable used to color lines)		<ul style="list-style-type: none">showPoints: add dotsalphaLines: modify line transparencyScale: scaling data("globalminmax"-no scaling; "uniminmax"-min=0&max=1; "std"-normalize; "center"-standardize and center)
Radar chart (Compare two or more groups on various characteristics)	<code>library(ggradar)</code> <code>ggradar(df)</code>		<ul style="list-style-type: none">values.radar: label the gridaxis.labels: label the variablesGroup.colours: change line colors

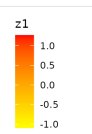

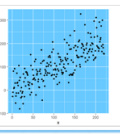

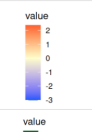

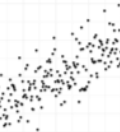

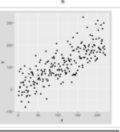

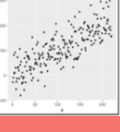

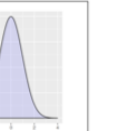

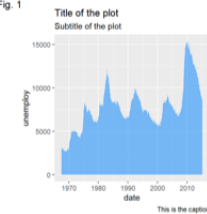

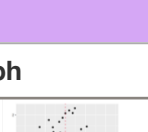

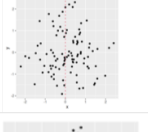

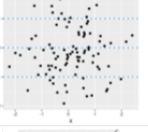

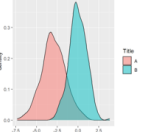

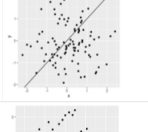

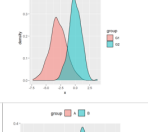

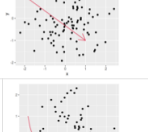

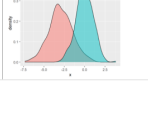

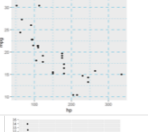

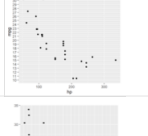

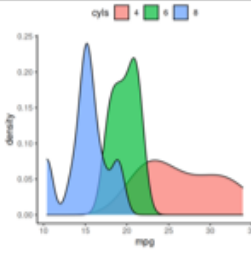

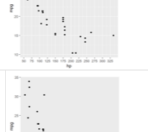

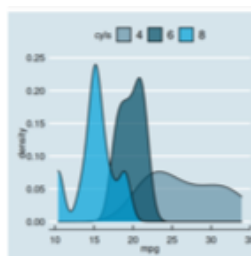

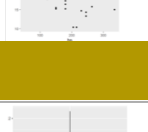

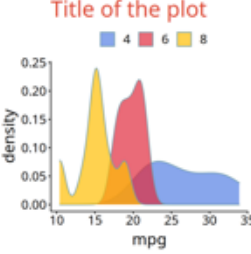

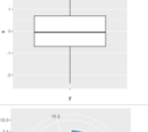

V. Part of a Whole

	Code	Graph	Argument/function notes
Bar chart (Display categorical variables)	<code>ggplot(df, aes(x = x, fill = group))</code> + <code>geom_bar()</code>		<ul style="list-style-type: none">width: control bin widthcoord_flip(): change to horizontal barplot
Donut Chart (Display individual categories percentages of the whole ; can compare a handful of categories)	<code>ggplot(df, aes(x = hsize, y = value, fill = group))</code> + <code>geom_col()</code> + <code>coord_polar(theta = "y")</code>		<ul style="list-style-type: none">theme_void(): get rid of unnecessary background, axis, etc.Hsize: change hole sizegeom_label(): add labels
Parliament Diagram (Visualize parliament layouts)	<code>library(ggparliament)</code> <code>ggplot(df, aes(x = x, y = y, colour = category))</code> + <code>geom_parliament_seats()</code> + <code>theme_ggparliament()</code>		<ul style="list-style-type: none">type: change type(eg."circle")geom_parliament_bar(): add a parliament bar showing the proportion of seats by party.
Pie chart (Compare different segment proportion of the data; only one category)	<code>ggplot(df, aes(x = "", y = value, fill = group))</code> + <code>geom_bar()</code> <i>#geom_col()</i> + <code>coord_polar(theta = "y")</code>		<ul style="list-style-type: none">theme_void(): get rid of unnecessary background, axis, etc.geom_text(): add labels
Tree maps (Display data that is grouped and nested in a hierarchical structure)	<code>library(treemapify)</code> <code>ggplot(df, aes(area = value, fill = group/value))</code> + <code>geom_treemap()</code>		
Venn Diagram (Illustrate logical relationships between two or more variables)	<code>library(ggVennDiagram)</code> <code>ggVennDiagram(list)</code>		
Voronoi Diagram (scattering points at random on a Euclidean plane)	<code>library(ggvoronoi)</code> <code>ggplot(df, aes(x, y))</code> + <code>stat_voronoi(geom = "path")</code>		
Waffle chart (Effective when comparing numbers that are highly variant)	<code>library(waffle)</code> <code>x <- c(30, 25, 20, 5)</code> <code>waffle(x, rows = 8)</code> Or <code>ggplot(df, aes(fill=group, values=value))</code> + <code>geom_waffle(n_rows=8, size=0.33)</code>		<ul style="list-style-type: none">iron(): combine different waffle chartskeep=FALSE: get rid of unused categories

VI. Flow

	Code	Graph	Argument/function notes
Alluvial Plot (Visualize change in groups between states or over time / useful for showing how features of a population are related)	<code>library(ggalluvial)</code> <code>ggplot(data = df, aes(axis1 = survey, axis2 = response, y = freq))</code> + <code>geom_alluvium(aes(fill = response))</code> + <code>geom_stratum()</code>		<ul style="list-style-type: none">aes(axis1, axis2, axis3,..): contain variables on x-axiscurve_type(in geom_alluvium): change flow type (eg. "linear", "cubic", "sigmoid")fill(in geom_alluvium): change flow colorfill(in geom_stratum): change stratum color
Sankey Diagram (Visualize the proportional flow between variables/ useful for showing flows or processes where the some quantity need to be tracked)	<code>library(ggsankey)</code> <code>ggplot(df, aes(x = stage, next_x = next_stage, node = node, next_node = next_node, fill = factor(node)))</code> + <code>geom_sankey()</code>		<ul style="list-style-type: none">aes(label=) +geom_sankey_label(): add labels and change label appearanceflow.alpha: modify flow transparencynode.color: change node color
Waterfall Chart (Illustrate the gradual transition in the quantitative value)	<code>library(waterfalls)</code> <code>waterfall(df)/</code> <code>waterfall(values=value, labels=group)</code>		<ul style="list-style-type: none">calc_total=TRUE: calculate the total(final result after the change)rect_width: control rectangle widthdraw_line: remove/add dashed line joining the rectangleslinetype: change line typefill_by_sign=TRUE: positive/negative values each have same colorfill_colours: change rectangles colortotal_rect_color: change total rectangle colorrect_border: change border rectangle color

CUSTOMIZATION

Color palette-1				Color							
Functions	Notes	Example	Graph	Functions	Notes	Example	Graph				
scale_fill_gradient	Allows changing the colors, setting a lower and a higher color to represent the values.	scale_fill_gradient(low="yellow", high="red")		Panel	Background	theme(panel.background = element_rect(fill = "#67c9ff"))					
scale_fill_gradient2	Add a mid color	scale_fill_gradient(low="#075AFF", mid="FFFFCC", high="FF0000")			Border	theme(panel.border = element_rect(fill = "transparent", # Needed to add the border color = 4, # Color of the border size = 2)) # Border width					
scale_fill_gradientn	Use a customized color palette	scale_fill_gradientn(colors=hcl.colors(20, "RdYlGn")) [passing 20 colors of "RdYlGn" palette]		geom_label()	Background	theme(plot.background = element_rect(fill = "#67c9ff"))					
scale_color_viridis_c	Use the viridis palette (most common form for color blindness)	argument option: There are some colormap options to use(A,B,C,D,E)			Border	theme(plot.background = element_rect(color = "black", # Border Color size = 2)) # Border width					
scale_fill_brewer	Use color palette from RColorBrewer package	scale_fill_brewer(palette="Dark2")		Margin							
scale_fill_manual	Use custom color palettes	scale_fill_manual(values=c("#999999", "E69F00"))		Customize margins	* set to 0 to remove margin * set to negative numbers to reduce more margin	theme(plot.margin = margin(t = 20, # Top margin r = 50, # Right margin b = 40, # Bottom margin l = 10)) # Left margin					
scale_fill_grey	Use grey scale	scale_fill_grey()									
scale_fill_hue	Quantitative color scale with evenly spaced hues										
Text				Title							
Functions	Notes	Example	Graph	Functions	Note	Example	Graph				
geom_text()	Allows adding text	geom_text(aes(x = -115, y = 25, label = "Map of the United States"), stat = "unique")		labs()	Set a title , a subtitle , a caption and a tag .	labs(title = "Title of the plot", subtitle = "Subtitle of the plot", caption = "This is the caption", tag = "Fig. 1")					
		geom_text(aes(label = state))									
geom_label()	Allows adding label	geom_label(aes(x = -115, y = 25, label = "Map of the United States"), stat = "unique")		Calander							
		geom_label(aes(label = state))		library(calendR) calendR()	Create a yearly calendar when specify the year in the year argument.	calendR(year = 2020)					
Package: ggrepel	Avoid overlapping	geom_text_repel(aes(label = state))			Create a monthly calendar when specify the year in the year argument.	calendR(year = 2022, month = 3)					
		geom_label_repel(aes(label = state))			Create a lunar calendar when specify the year in the year argument.	calendR(year = 2025, month = 9, lunar = TRUE)					
Lines, Arrows, Curves				Legend							
	Notes	Example	Graph		Notes	Example	Graph				
Vertical line	Add vertical lines	geom_vline(xintercept = -1:1, linetype = 1, color = 2:4)		Add	color, fill, shape or alpha inside aes						
Horizontal line	Add horizontal lines	geom_hline(yintercept = -1:1, linetype = 3, color = 4, lwd = 1)		Title	Change legend	guides(fill = guide_legend(title = "Title")) labs(fill = "Title") scale_fill_discrete(name = "Title")					
Diagonal line	Add diagonals	geom_abline(intercept = 0, slope = 1)		Label	Change label	scale_fill_hue(labels = c("G1", "G2"))					
Line Arrow	Add line arrow	geom_segment(x = -2, y = 1, xend = 1, yend = -1, color = 2, arrow = arrow())		Position	Change position	theme(legend.position = "top")					
Curve Arrow	Add curve arrow	geom_curve(x = -2, y = 1, xend = 1, yend = -1, color = 2, arrow = arrow())		Remove	Turn of the legend	theme(legend.position = "none")					
Grid				Themes							
Customization	Set the grid aesthetics and customize the color, line width and line type	theme(panel.grid = element_line(color = "#8ccde3", size = 0.75, linetype = 2))		In-Buit Themes	Notes	Example	Graph				
Grid Break	Customize the number of grid breaks	scale_y_continuous(breaks = seq(10, 35, by = 1))			theme_grey() [default]; theme_bw(); theme_light(); theme_linedraw(); theme_dark(); theme_void(); theme_minimal(); theme_classic()	ggplot(mtcars, aes(x = mpg, fill = cyls)) + geom_density(alpha = 0.7) + theme_classic() + theme(legend.position = "top")					
		scale_x_continuous(breaks = seq(50, 350, by = 25))			Package:ggthemes	The package contains several very popular themes. Some of them also come with their corresponding color scales.	ggplot(mtcars, aes(x = mpg, fill = cyls)) + geom_density(alpha = 0.7) + theme_economist() + scale_fill_economist() + theme(legend.position = "top")				
Remove Grids	Remove Grids	theme(panel.grid = element_blank())		Package:ggtech	The package provides themes inspired by tech companies, such as Airbnb, Google, Twitter or Facebook.	ggplot(mtcars, aes(x = mpg, fill = cyls)) + geom_density(alpha = 0.7) + ggtitle("Title of the plot") + theme_tech(theme = "google") + scale_fill_tech(theme = "google") + theme(legend.position = "top")					
Coordinate											
coord_flip()	Rotate the axes	ggplot(df, aes(x = x, y = "")) + geom_boxplot() + coord_flip()									
coord_trans()	Create transformed cartesian coordinate systems	ggplot(df, aes(x = x, y = y)) + geom_point() + geom_smooth(method = "lm")+ coord_trans(x = "log")									
coord_polar()	Create polar coordinates	ggplot(df, aes(x = x, y = y, fill = y)) + geom_bar(stat = "identity", color = "white", lwd = 1, show.legend = FALSE) + coord_polar()
